## Exercise 1.2.1

- ① Prove that  $\sqrt{3}$  is irrational. Does a similar argument work to show  $\sqrt{6}$  is irrational?
- ② Where does the proof of Theorem 1.1.1 break down if we try to use it to prove  $\sqrt{4}$  is irrational?

## Solution 1.2.1

- ① **Proof:** Suppose  $\sqrt{3}$  is rational. This means that there exists  $p, q \in \mathbb{Z}$  such that  $\frac{p}{q} = \sqrt{3}$ . Suppose  $p$  and  $q$  have no common factors. Then we have  $p^2 = 3q^2$ , which means  $p^2$  is divisible by 3. This implies that  $p$  is divisible by 3, so  $p = 3k$  for some  $k \in \mathbb{Z}$ . Substituting this back into the equation, we have  $9k^2 = 3q^2$ , which simplifies to  $3k^2 = q^2$ . This means  $q$  is also divisible by 3, which contradicts our assumption that  $p$  and  $q$  have no common factors. Therefore,  $\sqrt{3}$  is irrational.  $\square$

The same argument does show that  $\sqrt{6}$  is irrational.

- ② The fact that breaks the proof for Theorem 1.1.1 is that  $\sqrt{4}$  is a perfect square, meaning that  $p^2 = 4q^2$  doesn't imply that  $p$  is a multiple of 4. In fact,  $p = 2q$  implies that  $p$  is a multiple of 2, which isn't a contradiction.

## Exercise 1.2.5

Let  $A$  and  $B$  be subsets of  $\mathbb{R}$ .

- ① If  $x \in (A \cap B)^c$ , explain why  $x \in A^c \cup B^c$ . This shows that  $(A \cap B)^c \subseteq A^c \cup B^c$ .
- ② Prove the reverse inclusion  $(A \cap B)^c \supseteq A^c \cup B^c$ , and conclude that  $(A \cap B)^c = A^c \cup B^c$ .
- ③ Show  $(A \cup B)^c = A^c \cap B^c$  by demonstrating inclusion both ways.

## Solution 1.2.5

① **Proof:** Suppose  $x \in (A \cap B)^c$ . Then  $x \notin (A \cap B)$ , meaning  $x \notin A$  or  $x \notin B$ , which is equivalent to  $x \in A^c \cup B^c$ . Therefore,  $(A \cap B)^c \subseteq A^c \cup B^c$ .  $\square$

② **Proof:** Suppose  $x \in A^c \cup B^c$ . Then  $x \in A^c$  or  $x \in B^c$ , which is equivalent to  $x \notin A$  or  $x \notin B$ . This means  $x \notin A \cap B$ , so  $x \in (A \cap B)^c$ . Then,  $A^c \cup B^c \subseteq (A \cap B)^c$ .

Therefore, since  $(A \cap B)^c \subseteq A^c \cup B^c$  and  $A^c \cup B^c \subseteq (A \cap B)^c$ , we have  $(A \cap B)^c = A^c \cup B^c$ .  $\square$

③ **Proof:** Suppose  $x \in (A \cup B)^c$ . Then  $x \notin (A \cup B)$ , meaning  $x \notin A$  and  $x \notin B$ . This is equivalent to  $x \in A^c$  and  $x \in B^c$ , so  $x \in A^c \cap B^c$ . Then,  $(A \cup B)^c \subseteq A^c \cap B^c$ .

Now suppose  $x \in A^c \cap B^c$ . Then  $x \in A^c$  and  $x \in B^c$ , which is equivalent to  $x \notin A$  and  $x \notin B$ . This means  $x \notin A \cup B$ , so  $x \in (A \cup B)^c$ . Then,  $A^c \cap B^c \subseteq (A \cup B)^c$ .

Therefore, since  $(A \cup B)^c \subseteq A^c \cap B^c$  and  $A^c \cap B^c \subseteq (A \cup B)^c$ , we have  $(A \cup B)^c = A^c \cap B^c$ .  $\square$

## Exercise 1.2.6

- ① Verify the triangle inequality in the special case where  $a$  and  $b$  have the same sign.
- ② Find an efficient proof for all the cases at once by first demonstrating  $(a + b)^2 \leq (|a| + |b|)^2$ .
- ③ Prove  $|a - b| \leq |a - c| + |c - d| + |d - b|$ , for all  $a, b, c$ , and  $d$ .
- ④ Prove  $||a| - |b|| \leq |a - b|$ . (The unremarkable identity  $a = a - b + b$  may be useful.)

## Solution 1.2.6

- ① **Proof:** Let  $a, b \in \mathbb{R}$  such that  $a, b > 0$ .

**Case 1 (Both Positive):** Using the triangle inequality, we have  $|a + b| \leq |a| + |b|$ , but since  $a, b > 0$ , we have  $|a| = a$  and  $|b| = b$ . Therefore, we have  $|a + b| = a + b = |a| + |b|$ .

**Case 2 (Both Negative):** Both  $a$  and  $b$  will be positive but I'll add a negative to make things easier. Using the triangle inequality, we have  $|(-a) + (-b)| \leq |-a| + |-b|$ . Factoring out the negative, we have  $|-(a + b)| \leq |-a| + |-b|$ . Applying the definition of absolute value, we have  $|-(a + b)| = a + b$ ,  $|-a| = a$ , and  $|-b| = b$ . Therefore, we have  $|(-a) + (-b)| = a + b = |-a| + |-b|$ .  $\square$

- ② **Proof:** Simplifying the expression  $(a + b)^2 \leq (|a| + |b|)^2$  gives us  $2ab \leq 2|a| \cdot |b|$ , which is always true, as the left side can be negative, but the right side will always be positive. As we've just squared both sides which keeps the inequality, the original inequality  $a + b \leq |a| + |b|$  is true.  $\square$
- ③ **Proof:** Notice that  $(a - c) + (c - d) + (d - b) = a - b$ , implying that  $|a - b| = |(a - c) + (c - d) + (d - b)|$ . Using the triangle inequality, we have  $|a - b| = |(a - c) + (c - d) + (d - b)| \leq |a - c| + |c - d| + |d - b|$ .  $\square$
- ④ **Proof:**  $\square$

## Exercise 1.2.7

Given a function  $f$  and a subset  $A$  of its domain, let  $f(A)$  represent the range of  $f$  over the set  $A$ ; that is,  $f(A) = \{f(x) \mid x \in A\}$ .

- ① Let  $f(x) = x^2$ . If  $A = [0, 2]$  (the closed interval  $\{x \in \mathbb{R} \mid 0 \leq x \leq 2\}$ ) and  $B = [1, 4]$ , find  $f(A)$  and  $f(B)$ . Does  $f(A \cap B) = f(A) \cap f(B)$  in this case? Does  $f(A \cup B) = f(A) \cup f(B)$ ?
- ② Find two sets  $A$  and  $B$  for which  $f(A \cap B) \neq f(A) \cap f(B)$ .
- ③ Show that, for an arbitrary function  $g : \mathbb{R} \rightarrow \mathbb{R}$ , it is always true that  $g(A \cap B) \subseteq g(A) \cap g(B)$  for all sets  $A, B \subseteq \mathbb{R}$ .
- ④ Form and prove a conjecture about the relationship between  $g(A \cup B)$  and  $g(A) \cup g(B)$  for all sets  $A, B \subseteq \mathbb{R}$ .

## Solution 1.2.7

- ① The value of  $f(A) = f([0, 2]) = [0, 4]$  and the value of  $f(B) = f([1, 4]) = [1, 16]$ . We have  $f(A \cap B) = f([0, 2] \cap [1, 4]) = f([1, 2]) = [1, 4]$  and  $f(A) \cap f(B) = f([0, 2]) \cap f([1, 4]) = [0, 4] \cap [1, 16] = [1, 4]$ . Therefore,  $f(A \cap B) = f(A) \cap f(B)$ .

We have  $f(A \cup B) = f([0, 2] \cup [1, 4]) = f([0, 4]) = [0, 16]$  and  $f(A) \cup f(B) = [0, 4] \cup [1, 16] = [0, 16]$ . Therefore,  $f(A \cup B) = f(A) \cup f(B)$ .

- ② Let  $A = [-1]$  and  $B = [1]$ . The value of  $f(A) = f([-1]) = [1]$  and  $f(B) = [1] = [1]$ . We have  $f(A \cap B) = f([-1] \cap [1]) = f(\emptyset)$  and  $f(A) \cap f(B) = f([-1]) \cap f([1]) = [1] \cap [1] = [1]$ .
- ③ **Proof:** Suppose  $g(x) \in g(A \cap B)$ . Then,  $x \in A \cap B$ , meaning  $x \in A$  and  $x \in B$ . This implies that  $g(x) \in g(A)$  and  $g(x) \in g(B)$ . Then,  $g(x) \in g(A) \cap g(B)$ . Therefore,  $g(A \cap B) \subseteq g(A) \cap g(B)$ .  $\square$
- ④ **Conjecture:** Given an arbitrary function  $g : \mathbb{R} \rightarrow \mathbb{R}$ , it is always true that  $g(A \cup B) = g(A) \cup g(B)$  for all sets  $A, B \subseteq \mathbb{R}$ .

**Proof:** Suppose  $g(x) \in g(A \cup B)$ . Then,  $x \in A \cup B$ , meaning  $x \in A$  or  $x \in B$ . This implies that  $g(x) \in g(A)$  or  $g(x) \in g(B)$ . Then,  $g(x) \in g(A) \cup g(B)$ . Therefore,  $g(A \cup B) \subseteq g(A) \cup g(B)$ .

Suppose  $g(x) \in g(A) \cup g(B)$ . Then,  $g(x) \in g(A)$  or  $g(x) \in g(B)$ , meaning  $x \in A$  or  $x \in B$ . This implies that  $x \in A \cup B$ . Then,  $g(x) \in g(A \cup B)$ . Therefore,  $g(A) \cup g(B) \subseteq g(A \cup B)$ .

Since  $g(A \cup B) \subseteq g(A) \cup g(B)$  and  $g(A) \cup g(B) \subseteq g(A \cup B)$ , we have  $g(A \cup B) = g(A) \cup g(B)$ .  $\square$

## Exercise 1.2.11

Form the logical negation of each claim. One trivial way to do this is to simply add “It is not the case that ...” in front of each assertion. To make this interesting, fashion the negation into a positive statement that avoids using the word “not” altogether. In each case, make an intuitive guess as to whether the claim or its negation is the true statement.

- ① For all real numbers satisfying  $a < b$ , there exists an  $n \in \mathbb{N}$  such that  $\frac{a+1}{n} < b$ .
- ② There exists a real number  $x > 0$  such that  $x < \frac{1}{n}$  for all  $n \in \mathbb{N}$ .
- ③ Between every two distinct real numbers there is a rational number.

## Solution 1.2.11

- ① For all real numbers satisfying  $a < b$ , there exists an  $n \in \mathbb{N}$  such that  $\frac{a+1}{n} \geq b$ . *Intuition:* False.
- ② There exists a real number  $x > 0$  such that  $x \geq \frac{1}{n}$  for all  $n \in \mathbb{N}$ . *Intuition:* True.
- ③ Between every two distinct real numbers there is an irrational number. ?????? *Intuition:* True.

**Exercise 1.2.12**

Let  $y_1 = 6$ , and for each  $n \in \mathbb{N}$  define  $y_{n+1} = \frac{2y_n - 6}{3}$ .

- ① Use induction to prove that the sequence satisfies  $y_n > -6$  for all  $n \in \mathbb{N}$ .
- ② Use another induction argument to show the sequence  $(y_1, y_2, y_3, \dots)$  is decreasing.

**Solution 1.2.12**

①

②

## Exercise 1.2.13

- ① Show how induction can be used to conclude that

$$(A_1 \cup A_2 \cup \cdots \cup A_n)^c = A_1^c \cap A_2^c \cap \cdots \cap A_n^c,$$

for any finite  $n \in \mathbb{N}$ .

- ② It is tempting to appeal to induction to conclude

$$\left( \bigcup_{i=1}^{\infty} A_i \right)^c = \bigcap_{i=1}^{\infty} A_i^c,$$

but induction does not apply here. Induction is used to prove that a particular statements holds for every real value of  $n \in \mathbb{N}$ , but this does not imply the validity of the infinite case. To illustrate this point, find an example of a collection of sets  $B_1, B_2, B_3, \dots$  where  $\bigcap_{i=1}^n B_i \neq \emptyset$  is true for every  $n \in \mathbb{N}$ , but  $\bigcap_{i=1}^{\infty} B_i \neq \emptyset$  fails.

- ③ Nevertheless, the infinite version of De Morgan's Law stated in ② is a valid statement. Provide a proof that does not use induction.

## Solution 1.2.13

- ① **Proof:** Exercise 1.2.5 will be our base case. Assume that the statement  $(A_1 \cup A_2 \cup \cdots \cup A_n)^c = A_1^c \cap A_2^c \cap \cdots \cap A_n^c$  is true. Then, we need to show that the statement is also true for  $n + 1$ , giving us

$$\begin{aligned} ((A_1 \cup A_2 \cup \cdots \cup A_n) \cup A_{n+1})^c &= (A_1 \cap A_2 \cap \cdots \cap A_n)^c \cap A_{n+1}^c \\ &= A_1^c \cap A_2^c \cap \cdots \cap A_n^c \cap A_{n+1}^c. \end{aligned}$$

- ② The collection of sets are  $B_1 = \{1, 2, \dots\}, B_2 = \{2, 3, \dots\}, \dots$ . If you take their intersection until  $n$ , you will always get a number, i.e.,  $n = 100$ , you get the singleton set  $\{100\}$ . But the intersection of all the sets as  $n \rightarrow \infty$ , you get  $\emptyset$ .

- ③ **Proof:** Suppose  $x \in (\bigcup_{i=1}^{\infty} A_i)^c$ . Then,  $x \notin \bigcup_{i=1}^{\infty} A_i$ , meaning,  $x \notin A_i$  for all  $i \in \mathbb{N}$ . This implies that  $x \in A_i^c$  for all  $i \in \mathbb{N}$ , so  $x \in \bigcap_{i=1}^{\infty} A_i^c$ . Therefore,  $(\bigcup_{i=1}^{\infty} A_i)^c \subseteq \bigcap_{i=1}^{\infty} A_i^c$ .

Suppose  $x \in \bigcap_{i=1}^{\infty} A_i^c$ , meaning  $i \in \mathbb{N}, x \notin A_i$ , for some  $i \in \mathbb{N}$ . This implies that  $x \in A_i^c$ , for some  $i \in \mathbb{N}$ . Therefore,  $x \notin \bigcup_{i=1}^{\infty} A_i$ , meaning  $x \in (\bigcup_{i=1}^{\infty} A_i)^c$ . Therefore,  $\bigcap_{i=1}^{\infty} A_i^c \subseteq (\bigcup_{i=1}^{\infty} A_i)^c$ .

Since  $(\bigcup_{i=1}^{\infty} A_i)^c \subseteq \bigcap_{i=1}^{\infty} A_i^c$  and  $\bigcap_{i=1}^{\infty} A_i^c \subseteq (\bigcup_{i=1}^{\infty} A_i)^c$ , we have  $(\bigcup_{i=1}^{\infty} A_i)^c = \bigcap_{i=1}^{\infty} A_i^c$ .  $\square$

**Exercise 1.3.3**

**Solution 1.3.3**

**Exercise 1.3.8**

**Solution 1.3.8**
